## **Telehandler Ticket Goodyear**

Telehandler Ticket Goodyear - The telescopic handler or telehandler is a generally used equipment in agricultural and industrial applications. This machine is similar in look to a forklift and even works in a similar way, even though telehandlers are much more like a crane than lift truck. It has a telescopic boom which can extend upward and forwards from the motor vehicle. The boom has the capability to fit one of various attachments like pallet forks, a bucket, a lift table or muck grab.

The most common telehandler accessories are pallet tines. The telehandler is used in order to transfer products in areas where the loads cannot be transported by a typical lift truck. Telehandlers are particularly helpful for placing loads on rooftops for example, or for removing palletized cargo from with a trailer. A lot of the jobs that a telehandler can accomplish will otherwise need a crane and this particular machine can be expensive, not practical and not always time efficient.

The boom acts as a lever, extending and raising while bearing a load. Even though there are back counterweights, this could cause the telehandler to become more unstable. Hence, the greatest advantage of the telehandler is also its greatest limitation. As the working radius increases, the lifting capacity decreases. The working radius is defined as the distance between the front of the wheels and the center of the load.

For example, a telehandler with a 5000 lb capability with the boom retracted can safely lift as little as 400 lb when it is fully extended at a low boom angle. The equivalent equipment that has a 5000 lb lift capacity and the boom retracted could support up to 10,000 lb with the boom raised to 70 degrees. The operator has a load chart to help determine whether a specific lifting task can be completed in a safe and efficient manner. This particular chart takes into account the boom angle, the weight and height.
